Based on the user story "Block/Freeze Debit Card" and its acceptance criteria, here are 3 test cases designed to verify the core functionality, status visibility, and recovery options.

Test Case 1: Verify Card Block and Transaction Prevention
Objective: To ensure that when a user blocks a card, it is deactivated immediately and subsequent transactions are rejected.
* **Pre-conditions:**
* User is logged into the banking app.
* The user has an active debit card with sufficient funds.
* The card is not currently blocked.
* **Test Steps:**
1. Navigate to the card list and select the active debit card.
2. Tap the "Block Card" button.
3. Confirm the action in the pop-up dialog.
4. Wait for the confirmation message (should appear within seconds).
5. Attempt to make a small transaction using the blocked card (e.g., via POS terminal or online payment).
* **Expected Result:**
* The app displays a success message indicating the card is blocked.
* The attempted transaction is **declined** immediately.
* No funds are deducted from the account.

Test Case 2: Verify Blocked Card Status and Timestamp Display
Objective: To ensure that once a card is blocked, its status is clearly visible as "Blocked" with a timestamp in the card list.
* **Pre-conditions:**
* User is logged into the banking app.
* The user has successfully blocked at least one debit card (as per Test Case 1).
* **Test Steps:**
1. Navigate to the main card list view.
2. Locate the previously blocked card.
3. Observe the status label and any additional details displayed for that card.
* **Expected Result:**
* The card's status is clearly displayed as **"Blocked"**.
* A **timestamp** (date and time) indicating when the card was blocked is visible next to the status or in the card details.
* The visual representation of the card (e.g., icon or overlay) reflects the blocked state.

Day2
